Dark Field Blood Analysis for a Mobile Phone with the memon® Telephone Transformer

Dark field blood analysis to determine the protective effect of the memon® telephone chip before and after a 15 minute usage of a mobile phone.

Seldom do we come across anyone who doesn't use a mobile phone these days. People often note their sense of the harmful effects of these devices in many different ways. They emit and use electromagnetic radiation well outside the natural color range, in particular the 'microwave zone' of the natural light spectrum. Cordless phones are very similar to cell phones.

People who might be considered most at risk are of course children and young people as their nervous systems have yet to fully develop.

There is empirical medical proof to show that the emissions from mobile phones play a part in influencing and triggering the following health disorders:

- Eye irritation, clouding of the eye lenses
- Sleep disturbances, restlessness
- Learning difficulties, failing memory
- Difficulty concentrating
- Genetic damage (DNA strand breakage)
- Damage to cell communication
- Influence on central nervous system
- Weakened immune system
- Impaired hormonal system
- Increased risk of suffering from cancer
- Opening the blood brain barrier

The brain contains billions of them, and the brain of a child is still in the important process of fully developing. In fact because of the soft tissue of children's brains, radiations from cell phone permeate very deeply, whereas for an adult, whose brain is fully formed, the emissions penetration is much smaller.

The last of these health conditions 'opening of the blood brain barrier' is very important. The brain has a natural type of blood barrier that in effect allows it to protect itself from absorbing and building up heavy metals and other such toxins that might be in the blood. Common heavy metals can include lead, mercury (from fillings), cadmium, aluminum etc.... If it is weakened the brain's ability to keep these pollutions from being soaked up by the brain tissue can be diminished.

Prof. Leif-Salford of the University of Lund in Sweden has proven that the blood-brain barrier against toxic substances in our body becomes permeable after only a few minutes of mobile phone use.
The Results

In independent tests, the specific effects on blood cells have been carried out on behalf of memon® using dark field microscopy analysis by Ekkehard Scheller of the Neubeuern Health Centre.

Following are clear pictures of a person’s natural blood cell image (left), and the same person’s blood cells after using a mobile phone for fifteen minutes (right).

Clearly the blood cells show a reaction. The cells show decreases in activity and normal motion as well as being elongated and clumped. This may shed some light on why many people note headaches, tiredness and other symptoms from prolonged use. The last image (below) shows the same person under the same conditions of mobile phone use, except this time using a memon® harmonizing device on the back of the phone.

Clearly, the results are profound. This slide shows that the blood cell activity and health is apparently undisturbed by the presence of the mobile phone's emissions. In fact, compared to the first slide, it appears that the blood cells show better results than the before the test began. The most notable reason for this is that the memon® phone chip is also harmonizing the effects of electromagnetic emissions from the outside environments as well as from the phone itself.
